

IRON COBRA Hi-Hat Stands

*New
and
Improved*

HH905 & HH805

The new "Quik-Brace" solid arm is now standard on all Iron Cobra hi-hat stands. Plate action stability is radically improved... and footplate wobbling, twisting and "heel up" during playing are a thing of the past.

HH905 Lever Glide

(US PAT. NO. 4905565)

The latest version of the Lever Glide hi-hat now uses roller bearings at the lever fulcrum for smoother footboard action without wobbling. Because the HH905's stroke is longer than a traditional pull hi-hat, the Lever Glide offers tremendous expressive control in half-open  at playing.

HH805 Velo Glide

For players who want the response of the traditional direct-pull high-hat but don't want the traditional noise and wobble.

Quik-Brace Arm Plate

Faster and easier to set-up and much stronger than the traditional hi-hat radius rod, the solid arm Quik-Brace prevents footplate wobbling, twisting and "heel up". The Quik-Brace also contributes to the unbelievably smooth and stable action of Tama's new Iron Cobra Hi-hats.

IRON COBRA Hi-Hat Stands

New
and
Improved

HH905 & HH805

Our Iron Cobra hi-hat stands had to meet the same standard of flexibility, sensitivity, quiet performance and durability as our Iron Cobra bass drum pedals. To achieve this, Tama designers adopted a dual leg application which provides easy set-up, portability and is especially useful for double bass and twin pedal players. Iron Cobra hi-hats have an especially smooth action that's free of the annoying pedal wobbling and rattling noises that, until now, have always been a less desirable, but unavoidable aspect of traditional hi-hats.

Tilt System

With the Tilt System, the entire hi-hat stand can be angled during set up. An especially convenient feature for adjusting the angle of the top cymbal.

CLOB Security Clutch US PAT. NO. 4458574

When the T-bolt is tightened, the nut presses the rod's surface. As a result, the rod is pressed on by both the bottom lock nut and top section for complete security.

Non-Loosening Cymbal Rod (Pat. Pend.)

Specially shaped plastic and metal nuts which fit perfectly each other prevent the cymbal rod loosening.

Spare-The-Rod Tension Rod Protector (Increased Protection and Portability)

A tension rod is one of the most important parts of smoothly functioning hi-hat, and often the most vulnerable to getting bent out of shape in transport. Now you can spare your tension rod rigors of the road by simply and easily packing it in the specially designed upper section pipe. A small, but very significant Tama hardware innovation.

5 Way Tension Adjustment US PAT. NO. 4846040

Allows five different levels of tension (each step adds about 340 grams of tension). Changes in tension can be made quickly and easily and the setting levels are easily visible.

Dual Legs (Pat. Pend.)

Iron Cobra's dual leg structure makes it easy to add twin bass drum pedals to your set-up. Since there's no steel plate under the footboard, it's foldable for quick set-up, tear down and easy portability. There's no footplate wobbling and no "heel-up" during playing.

Plate Angle Adjustment

Footboard angles can be easily adjusted to any desired position.

Stabilizer

This adjustable stabilizer will be a great help for power players to keep the footboard action more stable.

Duo Spike (Pat. Pend.)

Allows for the use of rubber tips or spike, or both in combination.
